

Solution Requirements

Date	12 July 2026
Team ID	XXXXXX
Project Name	Credit Card Approval Prediction
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- **Functional Requirements (FR)** define specific behaviors, functions, or features of the system (What the system should *do*).
- **Non-Functional Requirements (NFR)** specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should *be*).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	Users securely log in to access the credit card approval system.	High
2	Authorization levels	Admin can manage applications; users can submit and view their own application status.	High
3	External interfaces	Connects with the trained ML model and applicant database for prediction.	High

4	Transactions processing	Processes user application details and generates approval/rejection results.	High
5	Reporting	Displays prediction results and application history to users and admin.	Medium
6	Business rules, etc.	Approval is based on applicant information processed by the machine learning model.	High
7	Compliance to laws or regulations	User data is securely stored and privacy is maintained according to standard data protection practices.	High
8	<i>Other</i>	Allows users to check application status anytime.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria

1	Performance & Speed	Prediction results should be generated quickly.	Response within 2–3 seconds
2	Scalability	System should support multiple users simultaneously.	Supports 100+ concurrent users
3	Security & Data Privacy	Protect user information using secure storage and encrypted communication.	HTTPS enabled and encrypted data
4	Reliability & Availability	System should be available whenever users access it.	99% uptime
5	Usability & Accessibility	Simple, user-friendly interface that is easy to use.	Easy navigation with responsive design
6	<i>Other</i>	System should be easy to maintain and update in the future.	Modular and maintainable code
